Benchmark protocol: from task specification to evaluation

Shared conditions. All methods use the same task interfaces, permitted actions, and assigned budgets.

1 Public task specification

Inputs. Business request, declared rules, query inputs, public features, and candidate descriptions.

Constraints. Permitted execution and checking actions, service tariffs, and task budget.

2 Acquired execution evidence

Feedback. Tool returns and public check receipts obtained through the method's permitted actions.

Adaptation. Each method uses its own acquired history; adaptive configurations update routing state from eligible feedback.

3 Independent task evaluation

Success criterion. Complete the required outputs, evidence, and task-specific consistency checks within budget.

Evaluator-only information. Final correctness labels and isolated diagnostic scores are excluded from method inputs and learning histories.
